BLADES

AXIAL

 Fluid is pumped downward or upward – ideal for liquid/solid mixing, suspending solids, blending or draw down (introducing air-vortexing). Best suited for low viscosity, high speed mixing.

RADIAL

 Fluid flows from the top and bottom with higher shear and turbulence and lower pumping – ideal for liquid dispersion. Best Suited for medium viscosity fluids and high speed applications.

TANGENTIAL

 Fluid moves in a swirling motion often with a surface vortex – ideal for high viscosity fluids at lower speeds. Paddle diameter can be close to the diameter of the vessel and provides a large surface area to contact product.
